

Bindery

Quick Start — From scattered pages to a printable booklet

What is Bindery?

Turns the scattered or scanned pages you already have into a clean, printable booklet in a few taps. Runs entirely on your device, on Android.

Why privacy-focused?

Merging, page management, conversion, booklet making — all run locally on your device's CPU. Your files never leave your device.

The only feature that touches the network is optional: importing a PDF from a URL you provide. Bindery is open source (GPL-3.0), so you can verify that yourself.

How to make a booklet?

1. Add your pages (pick a file or scan)
2. Choose your booklet layout (paper size, binding)
3. Generate the booklet
4. Print

Booklet settings

Paper size — the size of paper you'll load into the printer (A4, Letter, A5, A3, or source size). Folded, each half becomes a booklet page.

Signature size — how many sheets fold together (Single, 8, 16, 32, or Auto). The default "Single" is enough for most cases; for a thick document pick "Auto" and Bindery works out the best size for you.

Advanced settings (flip edge, binding direction, gutter, creep, separate cover printing, instructions page, blank page insertion) exist too — but most people never touch them, the defaults are enough.

Other tools

- **Merge** — combine multiple PDFs into one
- **Watermark** — add a watermark to your pages
- **Page numbering, rotating, reordering**

Scanning and reading

Scan → **PDF** — turn photos into a PDF with automatic perspective correction.

Built-in reader — night mode, in-document search, resume from where you left off.

Want to try it?

Bindery is currently in closed testing on Google Play. If you have an Android phone and want to try it, message me and I'll send the invite link.
